

# THE ROLE OF EDUCATION IN THE TRICHINOSIS PREVENTION

C. CONSTANTINESCU\*, M. E. IDOMIR \*

***Abstract:** The prospective research we made included 252 young people, of both sexes, with ages between 18 and 51 years old, coming from the rural and urban areas, from different places and with different levels of education. Most of the questioned students au were aware of the fact that human trichinosis was a problem of public health (88.5%) and a very high rate of them thought the sanitary education of population as being essential for preventing this parasitic disease (98.4%)*

***Key words:** trichinosis, questionnaire*
