**Abstract:** *The present paper has the purpose of realizing an incidence study of reno-ureteral malformations. It is based on imagistic data obtained from patients who want in cause services for any type of pathology. Therefore, a bond with afferent simptomathology was made. It has come to the conclusion that the majority of urinary malformations are mute form clinical point of view and only a small percentage of these generate hydro-nephrosis, urinal infections or a modification of biological parameters*

**Key words:** *renal malformation, urography, ecography, computer-tomography*
