**Abstract:** *This study of the gender profiles of the health care populations in Brasov County fills a gap in the research literature by presenting the relationship existing between morbidity and gender data. There are also used the experiences developed in 2 universities - Transilvania University of Brasov and Poznan University of Medical Science, in understanding the importance of health promotion for different kind of people and there are compared these data with the data from Poland, especially in the field of human behaviour and in the health promotion topics.*

**Key words:** *morbidity, gender, health promotion.*
